Tecnología al servicio  
de la calidad

Eugenio Fallone Hijos y CIA S.A.I.C.F.I.A.C. es una empresa de origen italiano que inició sus actividades en la ciudad de Milán en el rubro de inyección de matrizería de plástico. En el año 1949 mediante Decreto de radicación oficial del gobierno Argentino fue trasladada a dicho país como fábrica de interés nacional.

En el año 1962, acompañando el crecimiento de la industria automotriz la empresa comenzó a fabricar Bombas de Aceite para Fiat Argentina, Peugeot Argentina y Borgward Argentina. Con los años se convirtió en una de las empresas líderes en el mercado Argentino y única en América del Sur totalmente integrada en los procesos de inyección, sinterizado y mecanizado de partes y componentes para la fabricación del producto.

En el año 1997 la empresa decidió ampliar su gama de productos incorporando la fabricación de Arboles de Levas.

El riguroso control de calidad en cada una de las etapas de fabricación conforme a las especificaciones técnicas y a las Normas ISO 9001/2008 junto con el know-how adquirido han posicionado a la empresa tanto en nuestro país como en el mundo en un alto nivel de excelencia, agradeciendo a todos sus clientes el apoyo y la confianza otorgada.

*Eugenio Fallone Hijos is an Italian-origin company, which started its activities in the city of Milan in the field of plastic injection molding. In 1949, by an Official Settlement Decree issued by the Argentine Government it moved to this country as a plant of National Interest.*

*In 1962, following the automotive industry growth, the company began to manufacture Oil Pumps for Fiat Argentina, Peugeot Argentina, and Borgward Argentina. Over the coming years, it became one of the leading companies in the Argentine market, and the only one in South America featuring a fully-integrated plant. Processes for the production of the product, such as injection molding, sintering and machining of parts and components, helped in this way to strengthen its quality assurance.*

*By 1997, the company decided to enhance its product line by incorporating the manufacture of Camshafts.*

*Backed by the thorough Quality Control undergone by the different manufacturing stages in accordance with technical specifications, and ISO 9001/2008 Standards, as well as by the know-how achieved, our company has reached a quality excellence acknowledged not only by our market but also worldwide.*

*Our appreciation to all our customers for their support, and confidence.*

## Nuestra Gente ■

Una de las principales razones del éxito de la compañía, es el Capital Humano con que contamos, su dedicación y profesionalismo garantizan la alta calidad de nuestros productos, acompañado por una automatización de las operaciones más difíciles del proceso de producción. Todo ello nos posiciona como una empresa altamente competitiva, en una economía cada vez más globalizada.

## Our People ■

*One of the main reasons for the success of the company is our Human Resources, their dedication and professionalism assure the high quality of our products, also strengthened by the automation of the most difficult activities of the production process. All these features position our company as a highly competitive one, even in an increasingly global economy.*

## Inyección ■

La Sección de Inyección, provee todas las piezas de Aluminio requeridas en las distintas Bombas de Aceite que producimos. Estas se logran a partir de una aleación de aluminio, fundida en crisoles (a una temperatura superior a los 600 grados), que se procesan en inyectoras hidráulicas con una capacidad de compresión desde 100 ton. hasta 400 ton., controladas con mandos electrónicos.

A los efectos de un buen acabado, todas las piezas son Rebabadas y Granalladas, logrando bordes suaves y apariencia uniforme, y como último paso son revisadas una a una por un riguroso Control de Calidad.

## Injection Molding ■

*The Injection Molding Sector provides all aluminum pieces required by the different Oil Pumps produced by us. These pieces are manufactured from an aluminum alloy, melted in crucibles (at temperatures over 600°), and processed through hydraulic injection molding characterized by a compression capacity ranging from 100 to 400 tons, controlled by electronic means. For better finishing purposes, all pieces are subject to deburring and shot blasting processes resulting in soft edges and uniform shapes. Above parts are then and finally inspected one by one by a very exhaustive Quality Control.*

## Sección de Sinterizado ■

En este sector se fabrican todos los componentes internos tales como Engranajes, Rotores, Estatores, Pistones, Bujes y Cubetas entre otros.

El proceso nace con la Materia Prima que es base hierro atomizado con aleación de cobre y grafito, los cuales son compactados a elevadas presiones, a través de una matriz, en Prensas automáticas con ciclo continuo dándoles las diferentes formas a cada pieza, luego por cintas transportadoras pasan por Hornos de proceso continuo con atmósfera controlada a temperaturas superiores a los 1200 grados, produciéndose la sinterización, es decir la unión de los minerales brindándoles la dureza necesaria que confieren las

propiedades mecánicas y buen acabado superficial.

Luego las mismas son ajustadas en procesos tales como Rectificado y Torneado, asegurando que las piezas cumplan con los estándares dimensionales requeridos.

## **Sintering**

All internal components such as gears, rotors, stators, pistons, bushings and buckets, among others, are manufactured in this sector. The process begins with the raw material which is steel atomized with a copper and graphite alloy, compacted at high pressures and passed through a die, in automatic presses having a continuous-cycle providing each piece with different shapes. They are then transported by conveyor belts through the continuous-cycle furnaces, where the atmosphere is controlled at over 1200°, and where the sintering process takes place, i.e., the union of minerals. This activity provides for the necessary hardness, mechanical properties, and a good surface finishing. Pieces then undergo processes such as grinding and turning, assuring in this way compliance with the dimension standards required.

## **Mecanizado y Montaje**

En este departamento, conjugamos las piezas que recibimos de los distintos sectores antes mencionados, y a través de los Centros de Control Numérico, de última generación, que cuentan con tres y cuatro ejes con pallet rotativos adaptados a los distintos tipos de Bombas, así se cumplimenta el mecanizado automático de piezas de inyección. Luego de una limpieza, se ensambla sobre dispositivos específicos de admisión, obteniendo las Bombas de Aceite respectivas, como última etapa es realizado la prueba hidráulica dinámica en forma automática, utilizando bancos de prueba electrónicos con características idénticas a la del motor.

## **Machining and Assembly**

In these facilities, all pieces coming from the different above-mentioned sectors are brought together, and through different last-generation Centers of Numerical Control, having three and four axes with rotating tables adapted to the different kinds of Pumps, the automatic machining of injection molded parts and pieces is completed. After a cleaning process, pieces are assembled on specific receiving devices where Oil Pumps at a last stage are subject to a dynamic hydraulic testing, automatically driven, by using the electronic testing benches, having exactly the same features as engines.

## **Calidad**

La compañía está sumamente comprometida con la Calidad, considerando que siempre hay una mejora constante en busca de la Excelencia.

Para ello cuenta en producción, con controles en cada departamento (autocontrol), como así también de controles volantes, que son parte de la auditoría operativa. Finalmente contamos con un sector de Metrología, con equipamiento de última generación que nos permite contar con óptimos medios de medición como así también de testear que las piezas estén conforme a planos.

El proceso de Calidad es Total, dado que trabajamos continuamente sobre procesos eficientes, satisfacción del cliente y cumplimiento de toda norma y reglamentación vigente.

Todo ello está conforme los lineamientos de las Normas ISO 9001/2008 que nos permiten contar con certificados de Det Norske Veritas, con el Nro. 57019-2009-AQ-ARG-OAA y vencimiento el 23-07-2012.

## **Quality**

Our company is absolutely committed to Quality, fact which can be seen in the constant improvements in search of Excellence. For this purpose, the entire production process relies on controls (automatic controls) in each sector, in addition to the inspectors which are part of the operating inspection. Finally there is a Metrology sector having last-generation equipment for allowing an optimal metering as well as testing of pieces to be in accordance with drawings. Our Total Quality process results from continuously working on efficient processes, customer satisfaction, and compliance with all standards and rules in force. All the above meets 9001/2008 ISO Standards, certified by Det Norske Veritas, N° 57019-2009-AQ-ARG-OAA, expiring date being 23-July-2012.-

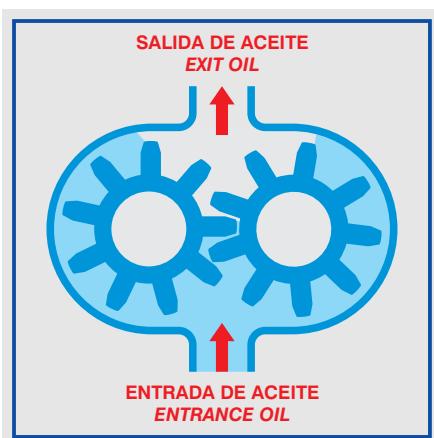

## Funcionamiento / Performance

El sistema de lubricación es vital para el correcto funcionamiento y vida útil del motor. La Bomba de Aceite es el CORAZON del motor, es el componente mecánico que sirve para poner en circulación el aceite, manteniendo un caudal y presión dentro de los límites dados por la característica de cada motor. Las bombas se diseñan de forma que consigan un CAUDAL adecuado a las superficies de los cojinetes y elementos a lubricar. La mayoría de las bombas reciben su movimiento a través del arbol de levas, sin embargo, algunas lo reciben a través del cigüeñal.

*The oil system is of vital importance for the correct operation and useful life of the motor. In fact, the oil pump is the HEART of the motor, it is the mechanical component that starts the supply of oil, keeping a flow and pressure range within the characteristics of each motor.*

*Pumps are manufactured to reach a FLOW necessary for lubricating bushing and part surfaces. Most pumps are driven by the camshaft and some others by the crankshaf.*

**Hay tres tipos de diseños de bombas / There are three pump designs**

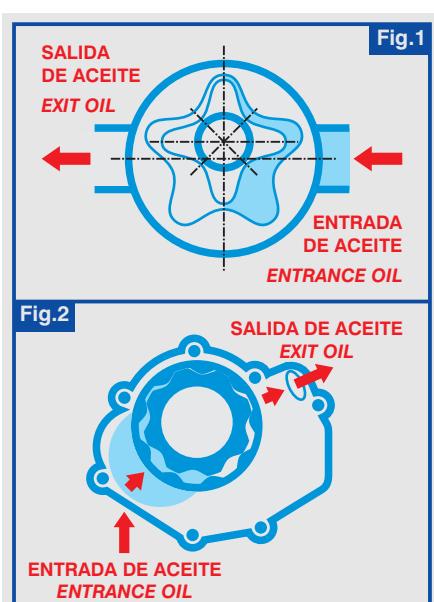

### 1- Bombas a Engranajes

En este tipo de bombas el movimiento es transmitido por el arbol de levas el cual a través del eje comando de la bomba, le da movimiento a los engranajes, los cuales producen el arrastre del aceite, que llega a través del filtro de la bomba. El aceite pasa a través de los huecos de los dientes de los engranajes, por ambos lados del cuerpo de la bomba, para salir por el otro extremo a las distintas canalizaciones de engrase del motor. La presión del circuito se regula a través de una válvula de alivio, la cual actúa cuando aumenta excesivamente la presión, por alto régimen de vueltas del motor o cuando la temperatura del aceite es muy baja, el exceso de la presión vuelve al cárter.

#### 1- Gear Pumps

*In these pumps, motion is transmitted by the camshaft which, through the pump control shaft, moves the gears to spread the oil coming through the pump filter. Oil passes through the spaces of the gear teeth at both sides of the pump housing, and comes out at the other end through the different motor grease passages. Pressure at this circuit is adjusted by a relief valve, and it operates whenever pressure is too high because of the increasing rate of motor turns, or whenever oil temperature is too low, the excess pressure returns to the crankcase.*

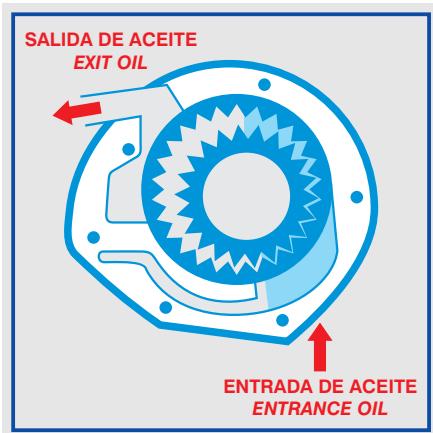

### 2- Bombas Lobulares

En este caso el movimiento puede ser transmitido por el arbol de levas, el cual a través del eje comando de la bomba, le da movimiento al rotor interno(Fig.1) ó por el cigüeñal, que se aloja en la figura interna del rotor interno(Fig.2). El rotor interno, al tener un lóbulo menos, hace rotar al rotor externo. Durante la rotación el aceite es succionado del cárter, pasando por el filtro de la bomba e ingresando a la cámara de admisión. Los espacios entre lóbulos aumentan al pasar por dicha cámara, por lo cual el aceite se aloja en los mismos y es transportado a la de compresión donde los espacios entre lóbulos se reducen provocando la expulsión del aceite al circuito de lubricación del motor.

### 2- Rotor Pumps

*In this case, motion can be transmitted by the camshaft which, through the pump control shaft, moves the internal rotor (Fig. 1) or by the crankshaft placed inside the internal rotor (Fig. 2).*

The internal rotor, having one lobe less, drives the external rotor. Throughout this rotation, oil is drawn out of the crankcase and passes through the pump filter, entering then into the inlet chamber. Spaces between lobes increase on passing through this chamber, oil remains in the spaces, and is then carried to the compression chamber, where spaces between lobes are reduced so producing oil to be exhausted into the motor oiling system.

### 3- Bomba a Engranajes Internos

En este caso el engranaje conducido está montado excéntricamente en el cuerpo de la bomba con respecto al engranaje conductor. El movimiento es transmitido por el cigüeñal. La rotación continua de la bomba forma un vacío parcial entre los dientes del engranaje conductor (interno) y los dientes del engranaje conducido (externo), esto causa que el aceite fluya en la bomba transportándolo, entre los dientes de los engranes y la medialuna del cuerpo, desde la cámara de admisión (entrada del aceite) hasta la cámara de compresión, en la cual los engranes, tanto el exterior como el interior, generan e incrementan la presión que fuerza al aceite a dirigirse hacia la línea de salida al circuito de lubricación del motor.

La ventaja de este tipo de bomba, comparándola con una de engranajes, reside en el aumento de la capacidad volumétrica.

### 3- Crescent Pumps

*In this other case, the driven gear is mounted eccentrically in the pump body as compared to the drive gear. Motion is transmitted by the crankshaft. The continue rotation of the pump produces a partial clearance between the driving gear teeth (internal) and the teeth of the driven gear (external). This action results in that oil flows in the pump and is carried through gear teeth meshing and the crescent body, from the inlet chamber (oil intake) to the compression chamber. Here meshings, internal and external, produce and increase pressure that forces the oil to pass through the outlet line into the motor oiling system. Advantage of these pumps, compared to gear ones, is the increase of volume capacity.*

#### Causas de Rotura o merma en el funcionamiento

##### 1- Colocación de la misma:

Montar la Bomba de acuerdo a lo enunciado en los puntos siguientes y utilizando las piezas adjuntas en los casos necesarios: (bujes, retenes, etc.).

a) Lubricar la bomba introduciendo aceite por el conducto de aspiración y girando luego los engranajes interiores a fin de esparrcir el aceite en el alojamiento de los mismos. Verificar la limpieza del cárter y utilizar aceite nuevo.

b) En caso de existir los orificios en el block del motor, colocar los bujes guía. Finalmente instalar la bomba. Luego girar el cigüeñal para que la bomba se posicione al conjunto motor.

c) Colocar la junta y de utilizarse sella junta, no excederse en el uso del mismo, ya que el residual puede ser absorbido por la bomba perjudicando el funcionamiento de la misma.

#### Causes of pump damage or inadequate performance

##### 1- Pump installation:

*Assemble the pump as stated in the following items, and use the enclosed pieces whenever necessary (bushings, retainers, etc.).*

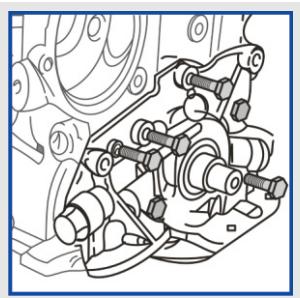

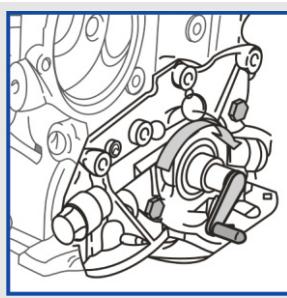

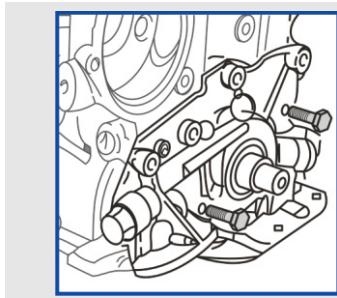

a) Supply oil to the pump through the intake pipe and then turn internal gears in order to spread the oil inside gear housings. Check that crankcase is clean, and that new oil is used.

b) In case there are holes in the motor block, position the guide bushings in place. Finally install the pump. The crankshaft should then be rotated for the pump to fit properly into the motor assembly.

c) Install the joint, and in case joint sealing is used, do not over use it because the residual sealing can be absorbed by the pump, and damage its proper performance.

**d)** Colocar primero los tornillos a través de los bujes de guía y ajustar. La bomba debe girar libremente, luego colocar el resto de los tornillos y ajustar con el torque correspondiente.

*d) First install the screws through the guide bushings and fasten. The pump has to rotate freely, then position the remaining bolts and fasten with appropriate torque.*

**ATENCION:** La no aplicación de las instrucciones indicadas, invalidan todas las eventuales responsabilidades sobre daños causados en la bomba de aceite / motor.

**ATTENTION:** Should above installation instructions not be followed, all potential responsibilities for damages caused to the oil pump or motor will void manufacturer's warranty.

## 2- Suciedad:

El peor enemigo de las Bombas de Aceite es la SUCIEDAD, ya que el mismo produce desgaste por abrasión en las partes internas de la bomba ocasionando una merma importante en la capacidad volumétrica de la misma; también puede tapar parte del filtro de aspiración de la bomba, ocasionando una restricción de succión de aceite.

## RECOMENDACIONES IMPORTANTES

Cada vez que se realice una reparación importante en el motor se debe cambiar la bomba y su respectivo aspirador, el filtro de aceite y la válvula de alivio, cuando esta no forma parte de la bomba.

El aspirador de aceite es el primer elemento en comenzar a obstruirse por las impurezas del aceite, como consecuencia de la carbonización directamente producida por combustible adulterado, tiempo de cambio de aceite excedido, mezcla de tipos de aceite, uso de aceite de bajas propiedades, etc.

Nunca se debe tratar de limpiar el tubo de succión para poder re-utilizarlo. Aunque aparente estar limpio, las cavidades de la malla están todavía contaminadas por las impurezas.

Al reutilizar el tubo de succión, que supuestamente estaba limpio, las impurezas contenidas en sus cavidades serán absorbidos por la bomba de aceite, causando daños irreparables a las partes internas (rotos o engranajes, etc.) y en consecuencia, repercutirá en el motor.

## 2- Dirt:

*Dirt is the worst enemy of oil pumps, it causes abrasive wear of pump internal parts which results in a significant loss of volume capacity. It can also obstruct part of the pump intake filter, so reducing the oil suction process.*

## IMPORTANT RECOMMENDATION

*Whenever a significant motor repair is made, the pump and its intaking device, as well as the oil filter and relief valve (whenever it is not included in the pump) have to be changed.*

*The oil intake component is the first one to become obstructed by oil dirtiness, resulting from the carbonization produced directly by contaminated fuel, oil changes in too long periods, mixture of different oils, use of low-property oils, etc.*

*The suction tube should never be cleaned for using it again. Even when it seems clean, the holes of the mesh are still contaminated by impurities.*

*When the suction tube, apparently clean, is reused, impurities coming from the holes will be absorbed by the oil pump, producing irreparable damages to inner parts (rotors or gears, etc.), consequently affecting motor performance.*

## MANAGEMENT SYSTEM CERTIFICATE

---

Certificate N° 117625-2012-AQ-ARG-RvA

*This is to certify that*

**EUGENIO FALLONE, HIJOS Y CIA. S.A.I.C.F.I.A.C.**

*Address*

**Hubac 4664 , Ciudad Autónoma de Buenos Aires , Argentina**

*has been found to conform to the Management System Standard:*

**ISO 9001:2008**

*This Certificate is valid for the following product or service ranges:*

**MANUFACTURE OF AUTOMOTIVE OIL PUMPS. POWDER METALLURGY PARTS  
FOR THE GENERAL INDUSTRY. PRESSURE FOUNDRY OF NON-FERROUS  
METALS**

**MANUFACTURA DE BOMBAS DE ACEITE PARA AUTOVEHÍCULOS. PIEZAS  
SINTERIZADAS EN POLVO METÁLICO. FUNDICIÓN A PRESIÓN DE METALES NO  
FERROSOS**

*Initial Certification Date:*  
**23 July 2003**

*Place and Date*  
**São Paulo, 03 Jult 2012**

*This Certificate is Valid Until:*  
**23 July 2015**

*for the Accredited Unit:*  
**DET NORSKE VERITAS CERTIFICATION B.V.,  
THE NETHERLANDS**
